Identify chronic kidney disease earlier: Screen with confidence, right from your EMR.

Type 2 diabetes contributes to 50% of kidney failure requiring dialysis, yet only 12–15% of diabetic patients in primary care are screened for chronic kidney disease (CKD). Amplify Care can support your practice to close that gap with an EMR screening toolkit and a dedicated facilitator who works alongside your team to build CKD screening into everyday workflow.

Why this matters: Hear from a clinician

"Primary care clinicians encounter several challenges when implementing CKD screening and management protocols. It can be difficult to keep track of the appropriate timing for tests, select the correct lab requisitions, and navigate the nuances of clinical guidelines, especially when managing patients with comorbidities. There's also a great deal of variability and uncertainty around which recommendations to follow." - Dr. Neil Naik

The CKD screening toolkit has been designed to remove these barriers by making evidence-based screening easier, faster, and more consistent.

What's included?

- **Identify patients who need screening:** EMR queries help identify patients at increased risk of CKD, including those living with type 2 diabetes and hypertension, who may benefit from screening.
- **Simplify ordering:** A universal lab requisition, based on the latest 2026 Ministry version, makes it easy to order recommended CKD screening tests alongside other commonly ordered investigations using built-in order sets.
- **Receive point-of-care reminders:** EMR alerts and chart reminders notify clinicians when patients are due for CKD screening, helping ensure opportunities for early detection aren't missed.

The toolkit is now available! If you'd like to see what participation could look like in your clinic, email EMRtools@amplifycare.com or fill out an expression of interest form here.

Build your CKD knowledge

Looking to strengthen your approach to CKD prevention and management? Our partners at CHEP+ are offering a live, accredited, peer-led education session on preventing diabetic nephropathy, with practical, evidence-based guidance for screening and managing CKD in people living with diabetes. **Register here.**
